

R Cheat Sheet

# **OpenML Objects**

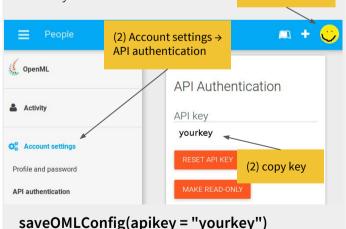

## Setup

- 1. Create account on OpenML.org
- 2. Install and load R package install.packages("OpenML")

library("OpenML")

3. Set key:

Getting/setting setup options

getOMLConfig() setOMLConfig()

saveOMLConfig(..., overwrite=TRUE)

Find your config-file: path.expand("~/.openml/config")

# Listing, Download, Running and Uploading

**Listing** - Result is always a data frame with info

# listOMLDataSetQualities() listOMLDataSets() listOMLFlows() listOMLTasks() listOMLTaskTypes() listOMLRuns() listOMLRunEvaluations()

listOMLEstimationProcedures() listOMLEvaluationMeasures()

**Downloading** 

getOMLDataSetQualities()

getOMLFlow()

→ OMLFlow

getOMLDataSet()

→ OMLDataSet

getOMLTask()

→ OMLTask

### Running models on tasks

## Example:

task = getOMLTask(task.id = 59) lrn = mlr::makeLearner("classif.rpart") run.mlr = runTaskMlr(task, lrn)

**Uploading** 

makeOMLDataSetDescription()

makeOMLDataSet()

uploadOMLFlow()

For more complex analyses see also mlr cheatsheet

### Data owner

Use cases

TODO: Upload a data set and create a task so that others can build models.

- 1. Clean data set
- 2. makeOMLDataSetDescription()
- 3. makeOMLDataSet()
- 4. uploadOMLDataSet()
- 5. Wait for data set to be active on OpenML.org
- 6. Create task on OpenML.org: go to your data set page → DEFINE A NEW TASK

In case users raise issues, start with step 1.

## Machine learner

TODO: Solve a task as well as possible.

- 1. getOMLTask()
- 2. mlr::makeLearner()
- 3. runTaskMlr()
- 4. uploadOMLRun() (this automatically also uploads the flow if not yet available)
- 5. Check performance of run on website and compare to other runs, if improvement possible/needed, return to step 2.

Benchmarker

TODO: Compare the performance of different

1. taskinfos = listOMLTasks(<characteristics>)

4. grid = expand.grid(task.id = tasks\$task.id,

5. myruns = lapply(seq\_row(grid), function(i) {

ind = grid\$lrn.ind[i]

2. tasks = lapply(taskinfos\$task.id, getOMLTask)

3. mylrns = lapply(<mylearners>, mlr::makeLearner)

lrn.ind = seq along(mylrns))

task = getOMLTask(grid\$task.id[i])

runTaskMlr(task, lrn.list[[ind]])

algorithms (learners) on different tasks.

## Other features

### Caching

getOMLRun()

→ OMLRun

list and get functions only download information that has not been downloaded before.

> convertOMLDataSetToMlr() convertMlrTaskToOMLDataSet()

> > convertOMLFlowToMlr()

convertMlrLearnerToOMLFlow()

convertOMLTaskToMlr()

convertOMLRunToBMR()

Cache

OpenML

around

objects can be

mlr objects and

the other way

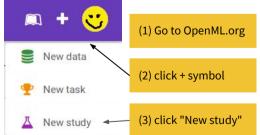

converted to

Find your cache folder: file.path(tempdir(), "cache")

Conversion OpenML (OML) -- mlr (Mlr)

Studies can be used to collect results of runs.

uploadOMLRun()

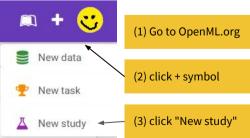

List all results of a study, e.g. study 34:

### **OpenML Studies**

uploadOMLDataSet()

They can be accessed via tag "study\_<#>" (replace <#> with a study number)

6. lapply(myruns, uploadOMLRun, tags = "<mytag>")

7. View results on OpenML.org or get results with evals = listOMLRunEvaluations(tag = "<mytag>")

(1) user profile
